

Group # 04 Java Coding Standards

1. General Rules

- Code must be **clean, readable, and consistent**
- **No dead code** (unused variables, methods, or classes)
- **No unresolved TODOs** in the final submission
- Code must **compile and run without missing dependencies**
- All required code must be **self-contained within the project**

2. Naming Conventions

Classes

- Use **PascalCase**

```
public class UserController  
  
{  
  
}
```

Methods

- Use **camelCase**
- Method names should start with a verb

```
public void calculateTotal()  
{  
}
```

Variables

- Use **camelCase**

```
int totalCount;  
String userName;
```

Constants

- Use **UPPER_CASE_WITH_UNDERSCORES**
- Must be static final

```
public static final int MAX_LIMIT = 50;
```

3. Braces Style (Mandatory)

- **Opening brace must be on the next line**
- This applies to **classes, methods, if/else, loops, try/catch**

```
if (isValid)
{
    processData();
}
else
{
    handleError();
}
```

4. Indentation & Spacing

- Use **4 spaces** for indentation
- Do **not** use tabs
- Add spaces around operators

```
int sum = a + b;
```

5. Access Modifiers

- Avoid default access
- Use:
 - private for fields
 - public for public methods
 - protected only when required

```
private int id;
```

```
public void save()
```

```
{
}
```

6. Use of final

- Use final for values that should not change

```
final int TIMEOUT = 30;
```

7. Comments

- Comments must be **clear and meaningful**
- Do not comment obvious code
- Remove commented-out code before submission

5. Package Structure

- Code must be organized according to the project architecture.
- Each class must be placed in the **correct package** based on its responsibility.
- Mixing responsibilities across packages is **not allowed**.
